

GSM and Iridium download options, more possibilities than ever before...

Followit Geo™

Followit Geo™ is a map-based web portal that allows for a number of new features previously unavailable for the Tellus GPS collars. It will bring your research to a new dimension by giving you new tools to follow the animals in detail and letting you interact with the collars remotely. Different types of access can be assigned for different users: Administrators have full access and can create and change schedules, groups, fences etc; Regular users can access to see all units, groups and download data; Observers have only authority to see units within the group they have been assigned.

Virtual fencing

With an easy-to-use boundary “fence”, you can select and activate one or more areas anywhere on the Followit Geo map. If any of your collared animals enters and/or exits an activated area, you will receive a signal with information about the animal involved. Each area can be as large or as small as desired - from a single den site, to a railroad track, or an entire national park. Followit Geo also allows for automatic changes in GPS positioning schedule when the animal crosses the virtual fence.

Real time updates on your smartphone

If you have an iPhone, iPad or Android, you can log on to Followit Geo to view the most recently updated locations from your collars.

2-way communication

You can log in to Followit Geo to change the programming schedule of your collars on the fly. Not only is it possible to change GPS positioning schedule, you can also activate the drop-off mechanisms for your collars from here.
